

ABSTRACT OF THE DISCLOSURE

When a vehicle mirror assembly is assembled, a bracket is firstly set as an assembling reference member, disposed on a bracket jig and positioned with respect to the bracket jig. Next, a retracting unit, a mirror surface adjustment unit, a door mirror stay and a mirror are mounted to the bracket. Finally a door mirror visor is mounted to the bracket. The bracket is made common regardless of a vehicle type thus a fixed bracket jig can be used resulting in cost reduction. Further, as the door mirror visor is mounted in a final process, defects of the door mirror visor due to scratches can be reduced thereby improving the production efficiency.
